

# JobFinder Nepal

## Master Product, Business, Trust, UX and System Design Document

**Positioning:** Nepal-first labour marketplace + fintech + trust platform

**Modes:** Quick Jobs + Regular Jobs

**Core promise:** Find work fast, hire fast, pay safely the same day.

---

### 1. Executive Summary

JobFinder Nepal is a mobile platform designed to solve two linked problems in Nepal:

1. Many people struggle to find work quickly.
2. Many people and businesses struggle to find reliable workers quickly.

The product combines:

- a **real-time labour marketplace**
- a **same-day escrow payment system**
- a **trust and verification layer**

The platform supports two product modes inside one app:

- **Quick Jobs** for short local tasks such as grass cutting, tree planting, furniture moving, wood cutting, farm help, construction help, cleaning, and other time-bound work.
- **Regular Jobs** for structured part-time, temporary, contract, and full-time work such as shop staff, restaurant staff, hotel workers, technicians, drivers, office helpers, and field workers.

The product is designed specifically for Nepal and for broad accessibility:

- educated and uneducated users
- rural and urban users
- low-literacy users
- Daily wage workers
- first-time smartphone users

This requires:

- multilingual support
- voice-guided UI
- icon-led navigation
- strict verification
- GPS support
- ratings and reputation
- semi-automated dispute handling
- escrow payment and clear fee structure

The business launches Nepal-first, but the system architecture should be prepared for future global expansion.

---

## 2. Strategic Vision

### Vision

To become Nepal's most trusted platform for work discovery, labour hiring, same-day payment, and reputation-based economic opportunity.

### Mission

- reduce unemployment and underemployment
- reduce labour shortage and hiring friction
- protect genuine users from fraud and scam
- make access to work and workers simple, fast, and trustworthy

### Strategic Product Identity

JobFinder Nepal is **not just a job board**.

It is:

- a labor marketplace
  - a fintech settlement layer
  - a trust infrastructure platform
- 

## 3. Problem Statement

### Worker-side problems

- difficult to find jobs quickly
- dependence on word-of-mouth or local contacts
- no easy digital identity for labor work
- fear of delayed payment or non-payment
- many workers do not have resumes
- many users have low digital literacy

## Employer-side problems

- hard to find workers nearby at the right time
- no fast way to verify reliability
- no guarantee workers will show up
- no simple way to manage payment and completion
- too much friction in existing hiring methods

## National relevance in Nepal

Nepal is an agricultural and developing economy with high labor fragmentation. A large share of work is local, informal, short-term, seasonal, or trust-based. At the same time, more structured employment exists in shops, restaurants, hospitality, offices, construction, logistics, and services. A useful national platform must support both.

## 4. Product Pillars

### 4.1 Accessibility

The product must work for literate, semi-literate, and low-literacy users.

Design implications:

- Nepali-first language support
- English support at launch
- future regional language packs
- voice assistance during onboarding and posting
- large buttons

- icon-led categories
- low-text screens

## **4.2 Speed**

The product must reduce time from need to action.

Examples:

- employer can post a Quick Job in under 2 minutes
- worker can accept a funded job in under 30 seconds
- payment can be released the same day after completion

## **4.3 Trust**

Trust must be visible and measurable.

Trust implications:

- strict KYC
- verified badges
- payment secured badge
- rating and reputation system
- audit trail
- GPS and proof-of-work options

## **4.4 Flexibility**

The app must support both informal and structured labor.

System implications:

- Quick Jobs and Regular Jobs in one platform
- fixed price and negotiable price options
- both worker and employer can switch roles

## 4.5 Scalability

The Nepal launch must not limit future expansion.

System implications:

- modular services
  - configurable fees and languages
  - pluggable payment connectors
  - country-ready localization model
- 

## 5. User Types

### Worker

Uses the app to:

- find Quick Jobs nearby
- apply to Regular Jobs
- negotiate price if enabled
- receive payment into wallet
- build reputation and trust score

### Employer

Uses the app to:

- post Quick Jobs or Regular Jobs
- choose fixed or negotiable pricing
- fund Quick Jobs through escrow
- track worker progress
- release payment and rate workers

## Admin / Operations Team

Uses internal console to:

- review verification
- monitor jobs and payments
- review fraud alerts
- handle disputes
- moderate users
- view operational analytics

---

## 6. Product Modes

### 6.1 Quick Jobs

Designed for local, time-bound, task-based work.

Examples:

- cut grass
- plant trees
- cut wood
- move furniture
- carry goods
- farm help
- construction assistance
- cleaning

Characteristics:

- local and location-sensitive
- short duration

- same-day payment focus
- escrow mandatory before work begins
- instant accept or negotiation

## **6.2 Regular Jobs**

Designed for more structured work.

Examples:

- shop helper
- waiter / waitress
- kitchen helper
- hotel staff
- driver
- office assistant
- technician
- full-time or part-time support roles

Characteristics:

- profile-based application
- chat and shortlist workflow
- lower-friction alternative to CV-heavy job portals
- optional voice intro in place of resume-heavy process

## **6.3 Shared system capabilities**

Both modes should use shared platform components:

- one identity system
- one wallet system
- one rating and trust system
- one chat system
- one admin layer

## 7. Registration and Data Capture

Registration is not only an onboarding step. It is the first trust layer.

### 7.1 Registration flow

1. app install
2. language selection
3. welcome and product introduction
4. phone number entry
5. OTP verification
6. choose role: Worker / Employer / Both
7. profile basics
8. location setup
9. KYC setup
10. payment rail setup
11. worker skill setup or employer setup
12. dashboard entry

### 7.2 Required data to capture

#### Identity and access

- mobile number
- OTP verification status
- full legal name
- display name
- date of birth
- profile photo
- role type
- preferred language
- accepted terms and consent

#### Location and matching

- current GPS location
- district / city / ward / village
- preferred work radius
- work availability

### **Worker-specific**

- work categories / skills
- experience tags
- availability state
- preferred job type (quick / regular / both)
- payout details

### **Employer-specific**

- individual / household / business type
- business or household name
- hiring preference (quick / regular / both)
- funding details

### **Verification**

- government ID type
- government ID number
- ID image front/back
- selfie / face match
- KYC review status

### **Payments**

- eSewa details
- bank details if applicable
- wallet status

## **7.3 Verification model**

### **Level 1: Basic Access**

- phone OTP verified

## **Level 2: Profile Complete**

- name, location, role, basic profile complete

## **Level 3: Strict Verification**

- ID documents submitted
- selfie / liveness submitted
- admin/system verification complete

## **Level 4: Trusted Status**

- verified account
  - good behavior history
  - successful completed jobs
  - low dispute ratio
-

## 8. Core User Journeys

### 8.1 Employer Journey - Quick Jobs

1. open app
2. tap **Post a Job**
3. choose **Quick Job**
4. select task type from icons
5. set location
6. choose fixed price or negotiable
7. enter price or range
8. set timing and duration
9. add description by text or voice
10. upload photo if needed
11. review job summary
12. fund job using eSewa / bank
13. payment moves into escrow
14. job becomes visible to qualified nearby workers
15. workers accept or negotiate
16. employer selects worker if required
17. chat / call / track progress
18. confirm completion
19. payment releases
20. rate worker

## 8.2 Worker Journey - Quick Jobs

1. open app
2. view nearby Quick Jobs
3. filter by distance, skill, amount, timing
4. see **Payment Secured** badge
5. open job details
6. accept if fixed or send offer if negotiable
7. receive confirmation
8. navigate to location
9. start work
10. upload progress or proof if needed
11. mark work completed
12. employer confirms or timer triggers auto-release
13. payment arrives in wallet
14. rate employer
15. save employer as favorite if desired

## 8.3 Employer Journey - Regular Jobs

1. choose **Regular Job**
2. set role title, category, schedule, pay type, location
3. add role requirements and shift details
4. publish role
5. receive applications
6. review candidate cards
7. chat with shortlisted candidates
8. schedule interview or trial shift
9. favorite strong candidates
10. hire or move to trial workflow

## 8.4 Worker Journey - Regular Jobs

1. browse regular job feed
  2. filter by category, district, pay, employer rating
  3. open role details
  4. apply with profile, skill tags, optional voice intro
  5. chat with employer
  6. track status
  7. attend trial or interview if selected
  8. accept offer if chosen
- 

## 9. Pricing and Negotiation Model

The system must support both market realities:

- fixed price
- negotiable price

### 9.1 Fixed price mode

Employer sets amount. Worker accepts instantly.

Best for:

- small local tasks
- urgent work
- clear market-rate tasks

### 9.2 Negotiable mode

Employer sets a range or expected budget. Worker sends counteroffer.

Best for:

- work with quality differences

Infrastructure for the labor economy in Nepal

- unclear task difficulty
- skilled labor where rate varies

### **9.3 Rules for negotiation**

- negotiation must happen inside the platform
  - accepted negotiated amount must update escrow requirement
  - final amount must be visible to both sides before work starts
  - negotiation history should remain in audit log
- 

## **10. Matching Engine**

The matching engine is critical for worker experience and employer confidence.

### **Inputs for matching**

- location proximity
- work category / skill fit
- availability state
- worker reputation score
- completion rate
- cancellation rate
- favourite employer/favourite worker relationship
- language preference if relevant
- payment funded status

## Prioritization principle

Closest + relevant skill + available now + strong trust score = highest rank.

## Output behaviour

- nearby online workers notified first
- strong matches shown higher in feed
- previous successful matches favoured where appropriate

---

# 11. Wallet, Escrow and Payment System

## Core principle

For Quick Jobs, money must be secured before work begins.

## Payment flow

1. employer adds money
2. employer funds job
3. money moves to escrow
4. worker sees **Payment Secured**
5. worker completes job
6. employer confirms completion or auto-release timer ends
7. worker wallet receives funds
8. platform deducts 2% fee

## Platform fee

**Recommended default:** 2% after job completion.

Example:

- gross job amount: NPR 1,000
- platform fee: NPR 20
- worker net payout: NPR 980

## **Wallet modules**

### **Worker wallet**

- available balance
- pending balance
- transaction history
- withdraw to eSewa or bank

### **Employer wallet**

- add money
- pay for jobs
- view funded jobs and refunds

### **Auto-release**

If employer does not confirm within policy time after worker marks complete, the system triggers auto-release or moves the case into semi-automatic review depending on risk signals.

---

## **12. Trust, Rating and Reputation System**

### **12.1 Visible trust elements**

- verified badge
- payment secured badge
- rating score
- completion history
- favorite indicator

- low cancellation badge / reliability badge

## **12.2 Rating model**

Keep the user-facing model simple:

- thumbs up / thumbs down
- quick tags such as punctual, honest, skilled, polite, no-show, poor quality
- optional comment

## **12.3 Reputation score inputs**

- completed jobs
- positive ratings
- repeat hires
- verification level
- response rate
- dispute rate
- cancellation rate
- recency of behavior

## **12.4 Fraud prevention inputs**

- duplicate IDs
- suspicious phone/device reuse
- repeated no-shows
- repeated complaints
- suspicious location behavior
- payment anomalies

---

# **13. GPS, Tracking and Proof Layers**

## **GPS capabilities**

- show nearby jobs
- show nearby workers
- support location-based matching
- support route-to-job navigation
- support arrival/proximity confirmation

## **Evidence layer**

For trust, disputes and quality review, the system should be able to store:

- chat history
- voice note history
- job timeline
- proof photos
- start and completion timestamps
- GPS events where allowed by policy

## **Privacy note**

Tracking must be purpose-limited, clearly disclosed and controlled by policy. GPS tracking should support trust and operations, not create unnecessary surveillance.

---

# **14. Chat, Voice UI and Favorites**

## **Chat system**

- one-to-one chat per job or application
- text messages
- voice messages
- image sharing where needed
- call button

## **Voice UI**

Voice is a strategic differentiator and should not be treated as optional decoration.

Voice-enabled areas:

- onboarding guidance
- category selection
- job description input
- application / introduction
- help center support prompts

## **Favorite system**

Users should be able to save:

- favorite employers
- favorite workers
- favorite jobs

Strategic value:

- repeat hiring
- retention
- trusted relationships
- better long-term marketplace quality

---

# **15. Admin and Operations System**

Admin is a core system, not a side panel.

## **Admin modules**

### **User management**

- user search
- profile review

- verification review
- status control
- restriction / suspension / ban tools

### **Job monitoring**

- active jobs
- delayed jobs
- cancelled jobs
- disputed jobs
- district/category filters

### **Payment operations**

- escrow states
- release logs
- refund logs
- failed transactions
- fee reporting

### **Trust and fraud operations**

- alert queue
- suspicious users
- repeated offenders
- duplicate identity review

### **Disputes**

- view full job evidence bundle
- recommendation engine output
- partial payout / refund tools
- final resolution controls

### **Analytics**

- job volume

- GMV
- fill rate
- completion rate
- payout velocity
- district demand/supply maps

### **Semi-automated disputes**

Required approach:

- simple cases can resolve by rules
  - medium cases get system recommendation
  - high-risk cases go to manual review
- 

## **16. Monetization Strategy**

### **Primary model**

#### **2% fee on completed jobs**

Why this works:

- clear and simple
- aligned with successful transactions
- easy to explain to users and investors
- scalable with marketplace growth

### **Secondary models**

- featured job boost for employers
- employer subscriptions for frequent hiring
- premium verification / enterprise trust packages
- analytics package for larger employers
- carefully controlled withdrawal or service fees if market allows

## **Recommended launch monetization strategy**

Start simple:

- launch with 2% transaction fee
  - do not overload users with too many charges
  - earn trust first, then layer premium monetization
- 

## **17. UX and Design Principles**

### **Product design principles**

- big buttons
- low-text cards
- icon + text pairing
- strong status visibility
- simple progress flows
- clear trust indicators
- multilingual system
- voice support

### **Key status vocabulary**

- Posted
- Payment Secured
- Accepted
- Negotiating
- In Progress
- Completed
- Released
- Disputed

### **Design language recommendation**

- green for funded / secure / active success states
  - blue for primary navigation and trusted system actions
  - amber for pending or caution states
  - red for fraud / issue / report states
- 

## **18. Screen Inventory - End-to-End**

### **Phase A: Entry and Authentication**

- splash screen
- language selection
- welcome / product intro
- phone number entry
- OTP verification
- role selection

### **Phase B: Registration and Setup**

- basic profile screen
- location setup screen
- KYC document capture screen
- selfie / face verification screen
- payment setup screen
- worker skill selection screen
- worker availability screen
- employer setup screen

### **Phase C: Main Navigation**

- worker home dashboard
- employer home dashboard
- shared bottom navigation

- side menu / account menu

## **Phase D: Quick Jobs - Employer Side**

- task type selection
- job details form
- fixed / negotiable price selection
- timing and deadline screen
- description and media upload
- review and pay screen
- job posted / waiting screen
- worker selection screen
- job in progress tracker
- completion confirmation screen

## **Phase E: Quick Jobs - Worker Side**

- nearby jobs feed
- map/list toggle
- filters sheet
- job detail screen
- negotiation screen
- accepted / on-the-way screen
- in-progress screen
- completion submit screen
- payout success screen

## **Phase F: Regular Jobs**

- regular jobs feed
- regular job details
- quick apply flow
- voice intro recorder
- application submitted state

- employer applicant list
- shortlist screen
- interview / trial scheduling

## **Phase G: Trust and Retention**

- rating screen
- profile reputation view
- favorites list
- saved jobs list
- repeat hire CTA flows

## **Phase H: Wallet and Payments**

- wallet home
- add funds
- payment confirmation
- withdraw funds
- transaction history
- payout receipt

## **Phase I: Support and Disputes**

- help center
- issue reporting
- dispute submission form
- case status screen

## **Phase J: Admin Console**

- admin dashboard
- user review queue
- KYC review queue
- job monitor table

- payment monitor table
  - fraud alert panel
  - dispute resolution workspace
  - analytics dashboards
- 

## **19. Full Digital Wireframe Direction**

The design team should produce formal wireframes and high-fidelity screens for all phases listed above. Each phase should include:

- mobile screen set
- navigation map
- state variations
- empty, loading and error states
- trust markers and fee visibility
- voice interaction touchpoints
- multilingual text treatment
- admin desktop workflow screens

### **Mandatory wireframe packages**

1. **Registration package**
  2. **Worker package**
  3. **Employer package**
  4. **Quick Jobs package**
  5. **Regular Jobs package**
  6. **Wallet and payment package**
  7. **Trust and rating package**
  8. **Support and disputes package**
  9. **Admin console package**
  10. **End-to-end master flowboard**
-

## **20. System Architecture**

### **High-level architecture**

- Mobile App Layer
- API / Backend Layer
- Core Domain Services
- Data Layer
- Payment Connectors
- Notification Services
- Admin Console
- Analytics Layer

### **Core service domains**

- Auth and Identity Service
- User Profile Service
- KYC Service
- Job Service
- Matching Engine
- Wallet and Escrow Service
- Chat and Notification Service
- Trust and Reputation Service
- Dispute Service
- Analytics Service
- Admin Service

### **Critical design principle**

Every important action must write an auditable event:

- registration
- KYC update
- job posted
- negotiation event

- job accepted
  - job started
  - job completed
  - payout released
  - refund issued
  - case opened
  - rating submitted
- 

## 21. Core Data Model Overview

### Important entities

- User
  - UserRole
  - UserVerification
  - WorkerProfile
  - EmployerProfile
  - Job
  - JobCategory
  - Offer / Bid
  - Assignment
  - Wallet
  - Escrow
  - Transaction
  - Conversation
  - Message
  - Rating
  - ReputationEvent
  - DisputeCase
  - FraudFlag
  - AuditLog
-

## **22. Phased Implementation Plan**

### **Phase 1 - Trust-ready launch core**

Focus:

- registration
- strict KYC
- Quick Jobs
- fixed and negotiable pricing
- escrow and wallet
- same-day release
- worker/employer rating
- admin basics

### **Phase 2 - Utility and retention expansion**

Focus:

- favorites
- repeat hiring
- improved chat and voice
- Regular Jobs
- shortlist workflow
- richer analytics
- employer paid boosts

### **Phase 3 - Scale and defensibility**

Focus:

- stronger fraud automation
- smarter matching
- enterprise employer features
- broader language support
- operational automation

## **Phase 4 - Future expansion readiness**

Focus:

- country configuration model
  - payment abstraction
  - localization packs
  - policy variations
- 

## **23. KPIs**

### **Marketplace KPIs**

- active workers
- active employers
- jobs posted
- jobs funded
- jobs accepted
- jobs completed
- fill time
- completion rate

### **Financial KPIs**

- GMV
- escrow funded volume
- total payouts
- platform fee revenue
- refund rate
- payout time

### **Trust KPIs**

- verification completion rate

- dispute rate
  - fraud flag rate
  - no-show rate
  - average rating
  - repeat hire ratio
- 

## **24. Risk Areas and Mitigations**

### **Risk: low trust at launch**

Mitigation:

- strict verification
- payment secured badge
- clear same-day payout messaging

### **Risk: too much complexity for low-literacy users**

Mitigation:

- voice UI
- icon-led categories
- progressive onboarding
- simple Quick Jobs priority flow

### **Risk: payment issues damage brand**

Mitigation:

- escrow-first design
- auditable ledger
- strong support process
- retry and failure handling

## **Risk: fraud and fake accounts**

Mitigation:

- KYC
  - event monitoring
  - fraud rules engine
  - admin controls
- 

## **25. Final Positioning for Investors and Partners**

JobFinder Nepal should be described as:

**A Nepal-first real-time labor marketplace + fintech + trust platform that connects workers and employers, secures same-day payment, and builds verified reputation across both quick local tasks and structured jobs.**

This framing is stronger than saying “job app” because it highlights:

- transaction value
  - trust moat
  - operational depth
  - monetization logic
  - long-term defensibility
- 

## **27. End-to-End System Flow Summary**

### **Master system flow**

Install app → Choose language → Verify phone → Select role → Complete profile → Complete KYC → Setup wallet → Choose Quick Jobs or Regular Jobs → Post or browse jobs → Match based on location/skills/availability → Accept or negotiate → Lock payment for Quick Jobs → Execute work → Confirm completion → Release

Infrastructure for the labor economy in Nepal

same-day payment → Rate counterpart → Update reputation → Retain through favorites and repeat engagement.

---

## 28. Final Note

The product should be built with the seriousness of a national marketplace and financial system. That means:

- every trust detail matters
- every money movement must be auditable
- every screen must reduce confusion
- every workflow must support both simplicity and control

**The winning strategy is not just building a feature-rich app. It is building a system that ordinary people in Nepal can trust enough to use for real work and real income.**
