

JobFinder Revenue Model & Financial Projection

Detailed strategy document for founders, investors, and operating team • Nepal-first, scale-first model

Core Revenue Engine	Monetization Structure	Growth Posture
Quick Jobs with hidden spread + withdrawal fee	Transactions + subscriptions + boosts + future fintech	Scale first, low friction, long-term financial expansion

1. Purpose of this document

This document explains, in one place, how JobFinder makes money, why the revenue structure is designed this way, how the Quick Job and Regular Job products should monetize differently, and what a realistic three-year financial projection looks like under a scale-first strategy.

Important note: these are internal business-model assumptions, not audited market results. They are meant to support investor conversations, business planning, and product decision-making.

2. Revenue model overview

- Quick Jobs generate transaction-linked revenue through a hidden pricing spread and a withdrawal fee on worker earnings.
- Regular Jobs generate non-transaction revenue through employer subscriptions because employment payments happen outside the platform.
- Workers can optionally pay for profile boosts and priority visibility, mainly on the Regular Job side.
- Over time, JobFinder can expand into financial services such as micro-loans, salary advance, and insurance distribution.

3. Quick Job model: how revenue is captured

Quick Jobs are the most important early revenue engine because they create frequent transactions and strong day-to-day platform usage.

Infrastructure for the labor economy in Nepal

Current commercial logic:

- Employer decides gross task budget
- Platform shows worker a slightly lower visible earning amount
- Difference becomes platform spread
- Worker pays a withdrawal fee only when withdrawing earned income
- Employer deposits and unused balance withdrawals are not charged

Quick Job Revenue Flow

Platform capture points:

- 1. Hidden spread on quick job pricing
- 2. Withdrawal fee only on earned income

Important rule: no offline cash option, so revenue leakage stays low and trust stays high.

Figure 1. Quick Job revenue flow and platform capture points.

3.1 Example: employer posts a NPR 200 task

Flow Step	Amount	Business Impact
Employer posts task	NPR 200	No visible extra charge, so posting friction stays low
Worker sees task value	NPR 190	Platform keeps NPR 10 hidden spread
Worker withdraws earnings	2% fee on earned amount	Platform captures second revenue layer

3.2 Unit economics for Quick Jobs

For projection purposes, the base-case model uses an average Quick Job gross value of NPR 300.

Base-case unit economics:

- Gross job value: NPR 300
- Hidden spread (5%): NPR 15
- Worker visible earnings before withdrawal: NPR 285
- Withdrawal fee (2% of NPR 285): NPR 5.7
- Total expected revenue per completed Quick Job: NPR 20.7, rounded to NPR 21

Revenue per Quick Job Example
(Based on NPR 300 gross job)

Figure 2. Revenue composition per representative Quick Job.

3.3 Why this model fits Nepal early on

- It feels simple to the employer because the app does not present a separate service fee line at posting time.
- It feels fair to the worker because withdrawal fee is tied to actual earnings, not registration or verification.
- It supports trust because all Quick Job money stays inside the platform via escrow.
- It reduces revenue leakage because cash-outside-the-app is not allowed.

4. Regular Job model: how revenue is captured without payroll transactions

Regular Jobs are different. In this product line, JobFinder helps employers find and shortlist candidates, but monthly salary or wages for the role usually happen outside the platform. That means commission-on-Infrastructure for the labor economy in Nepal

payment is not the main monetization method.

Instead, the revenue model should be built around recurring software-style access and marketplace visibility.

Regular Job Revenue Architecture

Regular jobs do not generate transaction commission, so recurring subscription revenue becomes the core monetization engine.

Figure 3. Regular Job monetization structure.

4.1 Employer subscription logic

Recommended structure:

- Free tier for trial and trust-building
- Paid tiers for serious repeat employers
- The value proposition is not payroll processing; it is hiring speed, candidate access, messaging, shortlist tools, and visibility

Tier	Indicative Price	Who it fits	Main value unlocked
Free	NPR 0	Households / trial users	Limited posting and limited applicant access
Basic	NPR 299/month	Small employers	More posts, full applicant view,

			messaging
Pro	NPR 999/month	Frequent hiring businesses	Unlimited or high-volume posting, priority visibility
Business	Custom	Larger companies / agencies	Advanced tools, reporting, account support

4.2 Worker premium on the Regular Job side

Workers should be allowed to use the platform for free, but paid boosts can create a second revenue line while also helping candidates who want faster visibility.

Examples:

- 7-day profile boost
- Priority placement in search
- Featured worker badge
- Highlighted profile card to employers

5. Future financial-services roadmap

The long-term opportunity is larger than marketplace fees. Once JobFinder has repeated transaction history, worker income trails, trust scores, and payout behavior, it can power financial products.

The strongest long-term revenue options are:

- Micro-loans for workers based on platform earnings history
- Salary advance products
- Insurance distribution and commission-sharing with partners

These should not be the first monetization layer. They become more powerful after the marketplace and trust system are established.

Infrastructure for the labor economy in Nepal

6. Financial model assumptions

Assumption	Base Case	Explanation	Sensitivity
Average Quick Job value	NPR 300	Representative blended value for small local tasks	High
Spread on Quick Jobs	5%	Hidden margin between employer gross and worker visible earnings	Medium
Withdrawal fee	2% of earned amount	Only on worker-earned withdrawals	Low
Jobs per active user per month	5	Assumes recurring usage on active cohort	High
Active user ratio	30% of total users	Conservative active monthly usage	High
Paying employer subs	5% of employers	Base subscription adoption on Regular Jobs	Medium
Worker boost adoption	10% of workers	Paid visibility usage assumption	Medium

7. Three-year user growth model

This projection intentionally follows a growth-first posture. The objective is to build liquidity in the marketplace before maximizing monetization pressure.

Infrastructure for the labor economy in Nepal

Figure 4. Total and active user growth assumptions.

Year	Total Users	Active Users (30%)	Comment
Year 1	50,000	15,000	Launch and early liquidity
Year 2	200,000	60,000	Network effects improve fill rate
Year 3	600,000	180,000	Scale across districts and categories

8. Revenue projection by stream

Figure 5. Projected revenue mix by year (Crore NPR).

Year	Quick Jobs	Employer Subs	Worker Boosts	Fintech	Total
Year 1	1.89	0.60	0.60	0.00	3.09
Year 2	7.56	3.00	2.40	0.00	12.96
Year 3	22.68	9.00	7.20	0.60	39.48

All values above are shown in Crore NPR.

8.1 How each revenue line is calculated

Quick Jobs

Formula = Active users × jobs per month × revenue per job × 12

Example Year 1 = 15,000 × 5 × 21 × 12 = NPR 18,900,000 = 1.89 Crore

Infrastructure for the labor economy in Nepal

Employer subscriptions

Assumption = paying employers × average monthly subscription × 12

Example Year 1 = 1,000 × 500 × 12 = NPR 6,000,000 = 0.60 Crore

Worker boosts

Assumption = paying workers × average monthly premium spend × 12

Example Year 1 = 5,000 × 100 × 12 = NPR 6,000,000 = 0.60 Crore

Fintech

Introduced in Year 3 only, after sufficient trust and earnings history exist.

9. Scenario view: conservative vs base vs aggressive

The base case above is designed to be ambitious but understandable. Investors will usually ask what happens under slower adoption or stronger-than-expected network effects. The scenario model below prepares that discussion.

Figure 6. Revenue scenarios by year (Crore NPR).

Infrastructure for the labor economy in Nepal

Year	Conservative	Base Case	Aggressive
Year 1	2.0	3.09	4.1
Year 2	8.2	12.96	17.5
Year 3	23.8	39.48	52.0

10. Why subscription helps users instead of hurting them

Subscriptions should not be positioned as a tax. They should be positioned as an access and productivity tool.

How subscriptions help employers:

- Save time by unlocking more candidates
- Post more frequently without friction
- Message shortlisted candidates directly
- Improve hiring speed and reliability

How subscriptions help workers:

- More serious employers post regularly
- Hiring quality improves
- Better employer commitment reduces fake or low-quality listings
- Paid employer plans can fund higher-trust hiring tools

11. Recommended monetization sequence

Phase	Primary focus	Revenue logic
Phase 1	Liquidity and trust	Quick Job spread + withdrawal fee only

Infrastructure for the labor economy in Nepal

Phase 2	Hiring tools and retention	Employer subscriptions + worker boosts
Phase 3	Financial depth	Loans, salary advance, insurance

12. Risks and controls

- Risk: users try to take payment offline. Control: no cash path, escrow-first design, in-app workflow controls.
- Risk: subscription resistance among small employers. Control: free trial tier plus clear value ladder.
- Risk: worker fee sensitivity. Control: no signup fee, no KYC fee, withdrawal fee only on earned income.
- Risk: low early trust. Control: strict verification, ratings, visible payment-secured badge, dispute support.

13. Executive conclusion

JobFinder's strongest early monetization engine is Quick Jobs, because it combines frequency, escrow control, and two revenue capture points. Regular Jobs should monetize through recurring employer subscriptions and optional worker boosts rather than payroll commission. Over time, the most valuable upside comes from financial services built on top of platform trust and earnings data.

In short:

- Quick Jobs drive transaction revenue
- Regular Jobs drive recurring software revenue
- Financial services create long-term margin expansion

That combination makes the business model structurally attractive if the team can build trust, liquidity, and disciplined marketplace operations early.
